

I: INTRODUCTION

The Gujarat state assembly elections were conducted in two phases. Phase-I and phase-II were held on the 11th and 16th December, 2007 respectively for 182 assembly constituencies. A post-poll survey conducted in 60 out of 182 assembly constituencies in Gujarat. The objective of the survey was to reflect the nature of voting behaviour and attitudes of people on electoral politics in the state. The survey was an attempt to understand the people's perception on the performance of state government as well as the government at the Centre. Another aim of the CSDS is to generate data bank of surveys held over the years in different parts of the country which helps to make interstate comparison on disposition of the electorates opinion towards different political parties, socio-economic, political, development, and governance issues and to understand electorates' behavior pattern which varies with region, community, religion, class, and gender. This post –poll survey was held on the 12 and 17 December 2007 to accomplish one of the aims of the organization.

II: SURVEY DESIGN

Selection of Assembly Constituency (AC):

For the post poll survey, it was decided to cover one-third of the total assembly constituencies, that is, 60 assembly constituencies. Gujarat Elections were held in two phases. In order to maintain consistency with the elections held, post poll survey was also conducted in two phases on a sample of 28 assembly constituencies and 32 assembly constituencies in phase I and phase II respectively. Assembly constituencies for the two phases were selected randomly using the probability proportionate to size (PPS) method. PPS method assures the same probability of larger as well as smaller sites.

Probability Proportionate To Size (PPS)

A list of all assembly constituencies were arranged in ascending order along with total number of electorates per assembly constituency then cumulative population of electorates was calculated. It was decided to conduct a survey in 60 assembly constituencies in the state out of the 182ACs. Thus, to arrive at sampling interval (SI) (or sampling constant), total population of electorates divided by 60 (suppose total electorates of the state was 60,00,000, divided by 60 then sampling interval becomes 100,000). After that, a number less than calculated sampling interval is selected randomly i.e. between one and SI, in the column of cumulative population of electorates (suppose, randomly selected number was 10,000). This number is Random Start (RS). Random start is the first Assembly constituency. Calculate the following series: RS; RS+SI, RS+2SI; RS+3SI..., and these numbers of calculated series were matched in the column cumulative population of electorates and thus, lead to random selection of the ACs.

Selection of Polling Stations (PS):

It was predefined to interview respondent from randomly selected four polling stations of each assembly constituency. In order to select the polling station from each AC, a comprehensive list of PS in each AC was prepared and the total number of polling stations were divided by four (a pre determined number from each AC) to arrive at the sampling constant or sampling interval.

First Polling station was selected randomly which ought to be less than sampling constant thereafter, sampling constant was added to the randomly selected PS to arrive at the second PS. This process was repeated for the selection of next polling stations in an assembly constituency. It is how; different polling stations were selected in each assembly constituency.

Selection of respondent:

Thirty respondents were randomly selected from the voter list of each polling station. The reason for sample size was to circumvent clustering and it also has logistic and methodological concerns. For this, a list of voters at each polling station was obtained and the total number of voters (at each PS) was divided by thirty to arrive at sampling constant¹. Sampling constant was added to the first respondent number to get next respondent and so on till selection of 30 respondent has completed.

For the present household survey a structured interview schedule was used and fieldworkers were cautiously selected. Only those who have acquaintance with the region were selected and given training thereafter as it facilitate in improving interviewer performance and subsequently, of the whole survey.

2.	Venue	Anand, Rajkot, Surat and Vadodra
3.	Number of Investigator	120
4.	Resource person(s)	<ul style="list-style-type: none">• Priyavadan M Patel (Vadodara)• A.Venkatraman (Surat),• Hemixa Rao (Rajkot) and Bhanu M Parmar (Anand)• Sanjay Kumar, Dhanajay Joshi and Praveen Rai , Delhi, CSDS

¹ If there are 3000 respondents of a polling station, divide 3000 by 30 that will be equal to 100. Thus 100 is the sampling constant for sampling respondents for the survey. The first respondent should be less than 100 drawn from random number table. Thus , if 89th voter is the first respondent selected then keep on adding 100, that is 89+100=189(second respondent), 189+100=289(third respondent) and so on till select 30 respondent
