

I: INTRODUCTION

Haryana state assembly elections were held on the 3rd February 2005. The elections were conducted for 90 seats. The findings of the Indian Express/CNN-IBN/CSDS survey reported here are based on a post-poll survey conducted in 20 out of 90 assembly constituencies in Haryana. The aim of the present post poll was to understand a disposition of the electorates which laid them to cast vote to particular party. Apart from that, it also helps to find and analyze the gap in electorates' opinion after pre poll survey which usually provides a vague picture of the electorates' frame of mind. Besides this, due to large sample size and wide coverage, it was decided to collect information on aspects linked with governance like development, socio-cultural and economic aspects, health, performance of the government and expectation from the next government.

II: SURVEY DESIGN

Selection of Assembly Constituency (AC):

For the post poll survey, it was decided to cover 20 of the total assembly constituencies; Assembly constituencies were selected randomly using the probability proportionate to size (PPS) method.

Probability Proportionate To Size (PPS)

A list of all assembly constituencies were arranged in ascending order along with total number of electorates per assembly constituency then cumulative population of electorates was calculated. It was decided to conduct a survey in 20 assembly constituencies in the state out of the 90ACs. Thus, to arrive at sampling interval (SI) (or sampling constant), total population of electorates divided by 20 (suppose total electorates of the state was 20, 00000, divided by 20 then sampling interval becomes 100000). After that, a number less than calculated sampling interval is selected randomly i.e. between one and SI, in the column of cumulative population of electorates (suppose, randomly selected number was 10,000). This number is Random Start (RS). Random start is the first Assembly constituency. Calculate the following series: RS; RS+SI, RS+2SI; RS+3SI..., and these numbers of calculated series were matched in the column cumulative population of electorates and thus, lead to random selection of the ACs.

Selection of Polling Stations (PS):

It was predefined to interview respondent from randomly selected four polling stations of each assembly constituency. In order to select the polling station from each AC, a comprehensive list of PS in each AC was prepared and the total number of polling stations were divided by four (a pre determined number from each AC) to arrive at the sampling constant or sampling interval.

First Polling station was selected randomly which ought to be less than sampling constant thereafter, sampling constant was added to the randomly selected PS to arrive at the second PS . This process was repeated for the selection of next polling stations in an assembly constituency. It is how; different polling stations were selected in each assembly constituency.

Selection of respondent:

Thirty respondents were randomly selected from the voter list of each polling station. The reason for sample size was to circumvent clustering and it also has logistic and methodological concerns. For this, a list of voters at each polling station was obtained and the total number of voters (at each PS) was divided by thirty to arrive at sampling

constant¹. Sampling constant was added to the first respondent number to get next respondent and so on till selection of 30 respondent has completed.

For the present household survey a structured interview schedule was used and fieldworkers were cautiously selected. Only those who have acquaintance with the region were selected and given training thereafter as it facilitate in improving interviewer performance and subsequently, of the whole survey.

* Counting for Haryana assembly elections was started on the 27th February and completed on the 5th March. The post poll survey analysis was completed before election's result announcement. In spite of it, declaration of post poll survey result was delayed. However, post poll survey could be announced before the announcement of election results. But it

¹ If there are 3000 respondents of a polling station, divide 3000 by 30 that will be equal to 100. Thus 100 is the sampling constant for sampling respondents for the survey. The first respondent should be less than 100 drawn from random number table. Thus , if 89th voter is the first respondent selected then keep on adding 100, that is 89+100=189(second respondent), 189+100=289(third respondent) and so on till select 30 respondent

was not done so because the purpose of post poll survey has been to enhance academic knowledge on attitudes and opinions of the masses instead of election forecast.
