I: INTRODUCTION

Delhi state assembly elections were held on the 29th November 2008. The elections were conducted for 70 seats. The findings of the CSDS survey reported here are based on a post-poll survey conducted in 29 out of 70 assembly constituencies in Delhi. The aim of the present post poll was to understand a disposition of the electorates which laid them to cast vote to particular party. Besides this, due to large sample size and wide coverage, it was decided to collect information on aspects linked with governance like development, socio-cultural and economic aspects, health, performance of the government and expectation from the next government.

II: SURVEY DESIGN

Selection of Assembly Constituency (AC):

For the post poll survey, it was decided to cover around three-fifth of the total assembly constituencies, that is, 29 assembly constituencies. Assembly constituencies were selected randomly using the probability proportionate to size (PPS) method. PPS method assures the same probability of larger as well as smaller sites.

Probability Proportionate To Size (PPS)

A list of all assembly constituencies were arranged in ascending order along with total number of electorates per assembly constituency then cumulative population of electorates was calculated. It was decided to conduct a survey in 29 assembly constituencies in the state out of the 70ACs. Thus, to arrive at sampling interval (SI) (or sampling constant), total population of electorates divided by 29 (suppose total electorates of the state was 29, 00000, divided by 29 sampling interval becomes 100000). After that, a number less than calculated sampling interval is selected randomly i.e. between one and SI, in the column of cumulative population of electorates (suppose, randomly selected number was 10,000). This number is Random Start (RS). Random start is the first Assembly constituency. Calculate the following series: RS; RS+SI, RS+2SI; RS+3SI..., and these numbers of calculated series were matched in the column cumulative population of electorates and thus, lead to random selection of the ACs.

Selection of Polling Stations (PS):

It was predefined to interview respondent from randomly selected four polling stations of each assembly constituency. In order to select the polling station from each AC, a comprehensive list of PS in each AC was prepared and the total number of polling stations were divided by four (a pre determined number from each AC) to arrive at the sampling constant or sampling interval.

First Polling station was selected randomly which ought to be less than sampling constant thereafter, sampling constant was added to the randomly selected PS to arrive at the second PS . This process was repeated for the selection of next polling stations in an assembly constituency. It is how; different polling stations were selected in each assembly constituency.

Selection of respondent:

Thirty respondents were randomly selected from the voter list of each polling station. The reason for sample size was to circumvent clustering and it also has logistic and methodological concerns. For this, a list of voters at each polling station was obtained and the total number of voters (at each PS) was divided by thirty to arrive at sampling

constant¹. Sampling constant was added to the first respondent number to get next respondent and so on till selection of 30 respondent has completed.

For the present household survey a structured interview schedule was used and fieldworkers were cautiously selected. Only those who have acquaintance with the region were selected and given training thereafter as it facilitate in improving interviewer performance and subsequently, of the whole survey.

Print Media			
Name	Title of Article	Name of Author	Date
Economic Political Weekly	Delhi Assembly Election:2008	Sanjay Kumar	7 th February 2009

¹ If there are 3000 respondents of a polling station, divide 3000 by 30 that will be equal to 100. Thus 100 is the sampling constant for sampling respondents for the survey. The first respondent should be less than 100 drawn from random number table. Thus , if 89th voter is the first respondent selected then keep on adding 100, that is 89+100=189(second respondent), 189+100=289(third respondent) and so on till select 30 respondent

III: DETAILS OF SURVEY TEAM

III. Details of Survey Team

The Survey fieldwork was coordinated by the CSDS Team. This team included Sanjay Kumar, Praveen Rai, Dhananjai Kumar Singh, Dhananjai Joshi, Kanchan Malhotra, Himanshu Bhattacharya, K.A.Q.A.Hilal.
